

Introducing CA ARCserve Central Protection Manager

CA ARCserve® Central Protection Manager is one of the CA ARCserve Central Applications. CA ARCserve Central Protection Manager provides both discovery and policy based backup configuration for CA ARCserve D2D , so protecting windows servers is a snap. Furthermore, CA ARCserve Central Protection Manager maintains a Microsoft SQL database for policy settings, as well as backup status and additional trend and performance metrics for each CA ARCserve D2D server. Additionally, protection status from CA ARCserve Backup servers can also be collected by CA ARCserve Protection Manager, providing even more visibility into recovery points.

OVERVIEW

Auto Discovery—Manual or scheduled Windows Domain based discovery can be used to populate nodes lists for both deployment and backup policy wizards.

D2D Deployment—Install CA ARCserve D2D to discovered Windows servers simultaneously.

Backup Policy—Create multiple backup policies that can easily be assigned to groups of servers.

CA ARCserve Backup Status—Configuring scheduled synchronization to import backup and SRM data from one or more CA ARCserve Backup server domains data for one or more backup domains.

SRM—Both application discovery and performance key indicators can be collected from CA ARCserve D2D servers, and can also be imported from scheduled CA ARCserve Backup synchronization.

Restore—Initiate different restore tasks on any remote protected Windows server including:

- Browse Recovery Points
- Browse File Copies
- Find Files/Folders to Restore
- Recover VM
- Restore Exchange Mail

Automatic Update—Product updates can be configured for each system, or via a proxy server.

BENEFITS

- One interface to manage multiple CA ARCserve D2D servers.
- Ships with Microsoft SQL express to speed installation.
- Selective auto discovery of Windows servers saves time in both deploying CA ARCserve D2D as well as adding systems to CA ARCserve Protection Manager.
- Policy based backup configuration allows faster initial configuration and subsequent configuration updates versus managing each CA ARCserve D2D instance.
- When time counts the most, centralizing the restore activities within the CA ARCserve Protection Manager simplifies access to initiate the recovery type to run on the protected CA ARCserve D2D server.
- Application discovery aids in defining the right protection policy and PKI collection consolidates metrics to assist in monitoring protected servers.
- Collection of CA ARCserve Backup server data consolidates recovery point, trend and performance metrics with CA ARCserve D2D data for easy access to determine available recovery points and system metrics for servers protected by either product.
- Stay current with the latest maintenance by retrieving web updates automatically from CA technologies.

Introducing CA ARCserve Protection Manager

Protecting your business from any interruption requires traditional tools like data backup, replication and high availability solutions. But with the growth of virtualization and cloud computing, you need a way to extend those traditional solutions to your virtualized and cloud environments. Introducing CA ARCserve Central Protection Manager, a web-based solution designed to unify and centralize critical data protection and recovery services.

- Common base framework so it looks and feels like other Central Applications
- Auto-Discovery to integrate physical or virtual CA ARCserve D2D servers
- Remote Deployment for one-to-many CA ARCserve D2D installations
- Policy-Based Administration so you can push central backup job policies to multiple targets
- Node and Group Management so you can more effectively manage your environment
- Remote Restore
- Auto-Update so you propagate software updates to all protected servers automatically or manually.

Frequently Asked Questions

- Q:** Can I use Protection Manager without installing CA ARCserve D2D?
- A:** No, CA ARCserve Protection Manager requires CA ARCserve D2D, centralizing management of CA ARCserve D2D.
- Q:** What versions of CA ARCserve D2D works with CA ARCserve Protection Manager?
- A:** CA ARCserve Protection Manager support CA ARCserve Backup D2D r16, which is also included in the Protection Manager install.
- Q:** Can a CA ARCserve D2D server be configured with more than one policy?
- A:** No, there can be multiple policies and multiple servers, but a server can be managed by only one policy.
- Q:** Does CA ARCserve Protection Manager require a license?
- A:** No, there is no license required for CA ARCserve Protection Manger, however; a license is required on each CA ARCserve D2D server being protected.

Summary

CA ARCserve Protection Manager eases the management of CA ARCserve D2D, by centralizing the discovery, deployment, and management of data protection tasks. Additionally, the central restore interface of CA ARCserve Protection Manager provides a single location to access recovery point data and initiate any valid restore activity on the local CA ARCserve D2D system. Be sure to review the tech brief on CA ARCserve Central Reporting, which presents a dashboard view the data collected by CA ARCserve Protection Manager.
